

ABSTRACT

Substrates (100) are described for receiving a plurality of samples, especially for the preservation of biological samples at cryotemperatures comprising a plurality of substrate plates (11, 12, 13) arranged on top of one another as a stack (10) and comprising an anchoring axis (20) to which the substrate plates (11, 12, 13) are connected. Processes for the preservation of biological samples at cryotemperatures are also described.
